# EVENTS AND EVENT HANDLING

Listening to events and working with event handlers

```jsx
const ExpenseItem = (props) => {

    let btnHandler = () => {
        console.log("Button clicked!")
    }

    return (
        <div className="expense-item">
            <ExpenseDate date={props.expDate}/>
            <div className="expense-item__description">
                <h2>{props.expTitle}</h2>
                <p className="expense-item__price">Rs {props.expAmount}</p>
            </div>
            <button onClick={btnHandler}>Change Title</button>
        </div>
    )
}
export default ExpenseItem;
```

No parenthesis ()
